

Amendments to the Claims:

The following listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Previously Presented) A packaging case-encased electro-optical device, comprising:
 - an electro-optical device where projection light from a light source enters an image display area, the electro-optical device including a pair of substrates;
 - a dust-proof substrate disposed on at least one of a light incident plane and a light emitting plane of the electro-optical device;
 - a first light blocking film formed on the dust-proof substrate;
 - a second light blocking film formed on at least one of the pair of substrates;and
 - a packaging case to hold at least a part of a peripheral area in a periphery of the image display area in the electro-optical device and housing the dust-proof substrate by having sides arranged at at least two sides of the dust-proof substrate, the packaging case including an opening that exposes therethrough the image display area of the electro-optical device, the second light blocking film, the first light blocking film, the dust-proof substrate and the packaging case configuring a heat conducting path.
2. (Previously Presented) The packaging case-encased electro-optical device according to claim 1, at least two of the second light blocking film, the first light blocking film, the dust-proof substrate and the packaging case contacting each other.
3. (Previously Presented) The packaging case-encased electro-optical device according to claim 2, the first light blocking film and the packaging case contacting each other.

4. (Previously Presented) The packaging case-encased electro-optical device according to claim 2,

the dust-proof substrate and the packaging case contacting each other, and at least one of the first light blocking film, and the second light blocking film, and the packaging case, contacting each other.

5. (Previously Presented) The packaging case-encased electro-optical device according to claim 1, the packaging case being formed of a material containing at least one of magnesium and aluminum.

6. (Previously Presented) The packaging case-encased electro-optical device according to claim 1, the dust-proof substrate being formed of sapphire.

7. (Previously Presented) The packaging case-encased electro-optical device according to claim 1, an end face light blocking film being further formed on an end face of the dust-proof substrate so as to be joined to the first light blocking film.

8. (Previously Presented) The packaging case-encased electro-optical device according to claim 7, a backside light blocking film being further formed on a surface of the dust-proof substrate where the first light blocking film is not formed, so as to be joined to the first light blocking film and the end face light blocking film.

9. (Original) The packaging case-encased electro-optical device according to claim 1, the first light blocking film being formed of aluminum.

10. (Original) The packaging case-encased electro-optical device according to claim 9, the first light blocking film having a multilayer structure of a layer formed of aluminum on the light source side and a layer formed of oxide film on an opposite side thereof.

11. (Original) The packaging case-encased electro-optical device according to claim 10, the oxide film containing a chromina (Cr_2O_3) film.

12. (Original) The packaging case-encased electro-optical device according to claim 1, the second light blocking film being formed of aluminum.

13. (Original) The packaging case-encased electro-optical device according to claim 12, the second light blocking film having a multilayer structure of a layer formed of aluminum on the light source side and a layer formed of chromium or chromina (Cr_2O_3) on an opposite side thereof.

14. (Original) The packaging case-encased electro-optical device according to claim 1, at least one of the first light blocking film and the second light blocking film being formed in a grid shape as viewed in plan view.

15. (Original) The packaging case-encased electro-optical device according to claim 1, further comprising a sealing material interposed between the pair of substrates configuring the electro-optical device for bonding the pair of substrates,

a shape of the second light blocking film including a closed curve along a perimeter of the substrate placed on the light source side,

a shape of the first light blocking film being a closed curve along a perimeter of the dust-proof substrate, the closed curve including a shape surrounding the second light blocking film, and

the sealing material being formed so as to be covered with the first light blocking film as viewed in plan view.

16. (Previously Presented) The packaging case-encased electro-optical device according to claim 15, the first light blocking film and the second light blocking film being formed so as to partially overlap each other as viewed in plan view.

17. (Currently Amended) A packaging case-encased electro-optical device, comprising:

an electro-optical device where projection light from a light source enters an image display area;

a dust-proof substrate disposed on at least one of a light incident plane and a light emitting plane of the electro-optical device;

a first light blocking film formed on the dust-proof substrate;

a second light blocking film formed on at least one of a pair of substrates, one substrate placed on a light source side and the other substrate, configuring the electro-optical device;

a packaging case to hold at least a part of a peripheral area in a periphery of the image display area in the electro-optical device and housing the electro-optical device and the dust-proof substrate, the second light blocking ~~films~~ film, the first light blocking film, the dust-proof substrate and the packaging case configuring a heating conducting path; and

a hook to keep the electro-optical device fixed to the packaging case, the hook configuring a part of the heat conducting path.

18. (Previously Presented) The packaging case-encased electro-optical device according to claim 17, the hook being formed of phosphor bronze.

19. (Original) The packaging case-encased electro-optical device according to claim 1, further comprising an intermediate layer disposed between the dust-proof substrate and the packaging case, the intermediate layer configuring a part of the heat conducting path.

20. (Previously Presented) A projection type display device, comprising:

a light source;

a packaging case-encased electro-optical device including:

an electro-optical device where projection light from the light source enters an image display area, the electro-optical device including a pair of substrates;

a dust-proof substrate disposed at at least one of a light incident plane and a light emitting plane of the electro-optical device;

a first light blocking film formed on the dust-proof substrate;

a second light blocking film formed on at least one of the pair of substrates; and

a packaging case to hold at least a part of a peripheral area in a periphery of the image display area in the electro-optical device and housing the dust-proof substrate by having sides arranged at at least two sides of the dust-proof substrate, the packaging case including an opening that exposes therethrough the image display area of the electro-optical device, the second light blocking film, the first light blocking film, the dust-proof substrate and the packaging case configuring a heat conducting path;

an optical system to guide the projection light to the electro-optical device; and

a projection optical system to project the projection light emitted from the electro-optical device.

21. (Previously Presented) A packaging case-encased electro-optical device, comprising:

an electro-optical device with an image display area irradiated with projection light from a light source;

a dust-proof substrate disposed on one of a light incident plane and a light emitting plane of the electro-optical device, the dust-proof substrate having a plate shape with a broad surface and a narrow surface, the narrow surface having a smaller surface area than the broad surface;

a light blocking film formed on at least one of a pair of substrates;

a packaging case to hold at least a part of a peripheral area of the image display area in the electro-optical device and housing the electro-optical device and the dust-proof substrate; and

a hook that engages with the packaging case and that has a surface that faces the broad surface of the dust-proof substrate, the light blocking film, the dust-proof substrate, the packaging case, and the hook configuring a heat conducting path.

• 22. (Previously Presented) A packaging case-encased electro-optical device according to claim 21, wherein the hook contacts the broad surface of the dust-proof substrate.
